Preferred compounds of formula (I) have a methyl substituent in the  $2\alpha$ -position of the penam nucleus and a substituted methyl substituent in the  $2\beta$ -position.

The carbon atom marked \* in formulae herein is asymmetric and thus compounds of formula (I) may exist as two optically active diastereoisomers. In general the isomer prepared from the D-side chain exhibits the highest antibacterial activity and accordingly the D compound or the DL mixtures are preferred, with the D compound being particularly preferred.

The compounds of formula (I) with the preferred D-side chain can be separated from a mixture of both diastereoisomers by conventional methods, or be prepared from intermediates that bear a D-side chain.

Moreover where  $R^4$  represents the formamido group, this can exist in two preferred conformations, those wherein the hydrogen atoms of the  $-NH-CHO$  are, cis-or trans-, of which the cis conformation normally predominates.

Impure preparations of the compounds may be used for preparing the more pure forms used in the pharmaceutical compositions. Although the purity of intermediate compounds of the present invention is less critical it will readily be understood that the substantially pure form is preferred as for the  $\beta$ -lactam antibiotic compounds. Preferably, whenever possible, the compounds of the present invention are obtained in crystalline form.

The dry lyophilised powder is then sealed in the vial and an accompanying vial of water for injection may be supplied to reconstitute the liquid prior to use. Parenteral suspensions are prepared in substantially the same manner except that the compound is suspended in the vehicle instead of being dissolved and sterilisation cannot be accomplished by filtration. The compound can be sterilised by

The antibiotic compounds of the present invention are active against a broad range of Gram positive and Gram negative bacteria, for example they are useful for treatment of respiratory tract and urinary tract infections in humans and are particularly useful in the treatment of bacterial infections in immunocompromised patients. A particular advantage of the antibacterially active compounds of the invention in which  $R^4$  is formamido, is their stability to  $\beta$ -lactamase enzymes and they are therefore effective against  $\beta$ -lactamase producing organisms.

The present invention further provides a process for the preparation of a compound of formula (I) or a pharmaceutically acceptable salt or pharmaceutically acceptable in vivo hydrolysable ester thereof, which process comprises treating a compound of formula (II):

or a compound of formula (II) wherein the amino group is substituted by a group which permits acylation, wherein  $R^4$  and X are as defined in respect of formula (I) and  $R^X$  represents hydrogen or a readily removable carboxyl protecting group with an N-acylating derivative of an acid of formula (III)

15 wherein  $\text{R}^3$ ,  $\text{R}^5$ ,  $\text{R}^6$  and  $\text{R}^7$  are as defined in respect of formula (I) and wherein any reactive groups therein may be protected and thereafter if necessary carrying out one or more of the following steps:

(i) removing any carboxyl protecting groups  $\text{R}^x$ ;

(ii) removing any protecting groups on  $\text{R}^3$ ;

(iii) removing any protecting group on X;

30 A carboxyl group may be regenerated from any of the above esters by usual methods appropriate to the particular  $\text{R}^x$  group, for example, acid-and base-catalysed hydrolysis, or by enzymically-catalysed hydrolysis, or by hydrogenolysis.

Suitable groups which permit acylation to take place and which are optionally present on the amino group of the starting material of the formula (II) include N-silyl, N-stannyl and N-phosphorus groups, for example trialkylsilyl groups such as trimethylsilyl, trialkyltin groups such as tri-n-butyltin, groups of formula  $-\text{P}(\text{R}^p)\text{R}^q$  wherein  $\text{R}^p$  is an alkyl, haloalkyl, aryl, aralkyl, alkoxy, haloalkyl, aryl, aralkyl, alkoxy, haloalkoxy, aryloxy, aralkyloxy or dialkylamino group,  $\text{R}^q$  is the same as  $\text{R}^p$  or is halogen or  $\text{R}^p$  and  $\text{R}^q$  together form a ring; suitable such phosphorus groups being  $-\text{P}(\text{OC}_2\text{H}_5)_2$ ,  $-\text{P}(\text{C}_2\text{H}_5)_2$ .

45 An appropriate reactive N-acylating derivative of the acid (III) is employed in the above process.

Other reactive N-acylating derivatives of the acid (III) include the reactive intermediates formed by reaction in situ with a condensing agent such as a carbodiimide, for example, N,N-diethyl-, di-*n*-propyl- or diisopropylcarbodiimide, N,N-di-cyclohexylcarbodiimide, or N-ethyl-N'-[3-(dimethylamino)propyl]-carbodiimide; a suitable carbonyl compound, for example, N,N'-carbonyldiimidazole or N,N'-carbonylditriazole; an isoxazolinium salt, for example, N-ethyl-5-phenylisoxazolinium-3-sulphonate or N-*t*-butyl-5-methylisoxazolinium perchlorate; or an N-alkoxycarbonyl 2-alkoxy-1,2-dihydroquinoline, such as N-ethoxycarbonyl 2-ethoxy-1,2-dihydroquinoline. Other condensing agents include Lewis acids (for example  $\text{BBr}_3 \cdot \text{C}_6\text{H}_6$ ); or a phosphoric acid condensing agent such as diethylphosphorylcyanoide. The condensation reaction is preferably carried out in an organic reaction medium, for example, methylene chloride, dimethylformamide, acetonitrile, alcohol, benzene, dioxan or tetrahydrofuran.

#### Example 5

Minimum Inhibitory concentration (MIC) values of compounds of the invention against *E.coli* JT425 and DC RTEM, *K. Pneumoniae* T767 and *P. aeruginosa* 10662 and K79961, were determined by serial dilution in Iso-sensitest Agar (from Oxoid Ltd., Basingstoke, England). The plates were inoculated with  $10^4$  colony forming units and incubated overnight at  $37^\circ\text{C}$ . The MIC values recorded in Table 1 were the lowest concentration of antibiotic to inhibit growth. Comparative data for Piperacillin which is the compound 6 $\beta$ -[D-2-[(4-ethyl-2,3-dioxopiperazin-1-yl)carbonylamino]-2-phenylacetamido]-penicillanic acid, sodium salt and for the compound 6 $\alpha$ -formamido-6 $\beta$ -[D-2-[(4-ethyl-2,3-dioxopiperazin-1-yl)carbonylamino]-2-phenylacetamido]-penicillanic acid, sodium salt (Compound A) disclosed in U.K. Patent GB-2107307B, are also given.
